

PREPARE BETTA FISH SPAWNING TANK

Written by Tossatam Siripoonsap

Many betta lovers failed in breeding betta with many reasons. One of the main reason is the condition of spawn tank is not suitable so the male doesn't make bubble nest...he doesn't want to breeding.

Today I would like to share how to prepare betta fish spawning tank. It's my way. I usually prepare spawn tank with this solution...GUARANTEE 90% success!!

1.I use tap water for breeding betta fish...add tap water into spawn tank about 4-5 inch height. Add a little salt and put 2-3 Indian Almond leaves into the tank. Put aquarium plants that you can find at your home. See the picture.

// 2. Put the male & the female's tank into this spawn tank. Let them look at one another. Give them food 2 times daily.

Leave it about 5-7 days...then put the male & the female into this spawn tank.

I think you will success in breeding your betta fish :)
