

Betta fish care : Show the result of feeding betta fish boy with a lot of food

I would like to show you my last generation of black dragon halfmoon plakot.

This is the picture before I feed this fish with a lot of food...he is 1.5 months old.

I feed this fish with frozen blood worms and pellet 2-3 times per day. In the morning , I give him pellet food and I give him frozen blood worms in the afternoon and the night...be careful,if you give too much food, your betta boy will die. I replace his water 100% every 3 days...let him flare with other males about 2 hours per day.

// One week later...This is the result :

He looks so awesome. Full dragon with sharp fin :)
